Refrigerants used in Mobile A/C systems

R-134a is also known as Tetrafluoroethane (CF₃CH₂F) from the family of HFC refrigerants. R-134a is the most common refrigerant, found in the vehicles from the early '90s and should remain available for aftermarket distribution next 15 years. R-134a is non-flammable and non-explosive, has toxicity within limits and good chemical stability.

R-1234yf is a hydrofluoroolefin (HFO) refrigerant. Due to its composition, R-1234yf is a more environmentally friendly alternative to R-134a. It does not damage the ozone layer or has minimal global warming impact and it is used in all new vehicles. R-1234yf is classified as "mildly flammable", and requires the use of equipment compliant for use with such a refrigerant.

R-744 is actually CO₂, which is used in limited number of vehicles. R744 (CO₂) is environmentally friendly, having zero ODP (Ozone Depletion Potential) and minimal GWP (Global Warming Potential), but the very high operating pressure requirements is preventing it to become a mainstream in mobile a/c systems.

All refrigerants should be stored in a cool, dry location, out of direct sun light. Handle refrigerants with care, always wear protective gloves and glasses. Avoid inhalation of the refrigerants.

Compressor oil used in Mobile A/C systems

The purpose of compressor oil is to provide lubrication for the compressor. The manufacturer of the vehicles or compressors determines the viscosity and lubricant type needed. There are 3 major a/c compressor oil types on the market:

- **PAG OIL (Poly-alkalene-glycol)** is synthetic lubricant used with R-134a systems, except in electrical compressors. PAG oils are highly miscible with R-134a and are suitable for lubricating the a/c systems of most passenger and commercial vehicles. Even a small amount of PAG oil can cause leakage of the high voltage in an electric compressor damaging the system. Some electrically powered compressors for hybrid vehicles are filled with **special** PAG Oil. When using PAG oils, ensure that you select the correct viscosity (PAG 46, PAG 100, PAG 150). Observe the specifications and approvals of the vehicle manufacturers. PAG oils are hygroscopic, they absorb the moisture from the ambient air. This is why opened oil containers must be resealed immediately or if not be discarded.

- **POE OIL (Poly-ol-ester or Ester)** is synthetic lubricant used on vehicles with electrical compressor (hybrid and electrical). Just like PAG oils, POE oils are hygroscopic and can absorb moisture. The time allowed for the oil to be exposed to the atmosphere has to be very short.

- **PAO OIL (Poly-alpha-olefin)** is synthetic oil of controlled molecular structure. It is becoming increasingly popular because of its stability and compatibility. Unlike other oil types PAO OIL is not hygroscopic; it does not absorb humidity from the ambient air and a service technician can draw the amount needed for a job from a bulk container. PAO OIL does not need expensive single use packaging.

PAO OIL is suitable for use with R134a & R1234yf and for use in electrical compressors in hybrid vehicles.
